

Thilot hand seeder HZ.423

A hand seeder which excels in practical simplicity. In all its parts designed efficiently. That is the Thilot HZ.423.

Owing to its fair-sized pilot-wheels and simple transmission mechanism, this machine can be turned and moved around very easily. The seeder has been constructed both for sowing in continuous lines and for step-sowing. The mechanism for step-sowing can easily be coupled in or out.

The seeding-mechanism consists of a special seed-brush which renders the machine suitable for sowing all kinds of seeds, coarse as well as fine. The seed-brush conveys the seed regularly without bruising or damaging it. The desired quantity can be chosen by regulating the seed-disc. The seed-flow is constantly visible.

The desired depth of sowing can be easily obtained by vertical adjustment of the seed-pipe foot. The furrow in which the seed falls will be closed by the flat rear-wheel, which also exerts an equal gentle pressure onto the seed.

When step-sowing is required, the desired distances are obtained by means of special-pitched sprockets.

These render it possible to sow at distances of 120-60-40-30-25 and 20 centimeters.

While seeding an adjustable marker sets out the next sowing line.
